

GuidelyEdu-PRD-Addendum

Addendum — GuidelyEdu PRD (2026-08-16)

This file holds delivery mechanism, stack, and rejected alternatives. It is **not** the product contract. Capabilities live in `prd.md`.

1. Delivery stack (user-directed, 2026-08-16)

Paul instructed that GuidelyEdu will be built as a **Laravel + Vue** application and converted into a **hybrid mobile app**. The March 2026 business plan specified PostgreSQL, a cloud application service, SRE as an internal backend, Rule tables in the database, and Protégé for Ontology authoring. It did **not** name Laravel or Vue.

Decision: Honour the user stack for application code; keep the business plan's data and knowledge-engineering choices.

Build scope (2026-08-20): Implement **FR-1–FR-60** in the first Laravel release. Tenant feature flags control which surfaces a Pilot or Trust sees; they do not remove FRs from the backlog. Stack versions are pinned in Architecture AD spine (Laravel 13 / Vue 3.5 / Capacitor 8 / PostgreSQL 18 family as of Aug 2026 verification).

Layer	Choice	Reason
API / domain	Laravel (see Architecture for minor version), JSON API	One server language for RBAC, Audit Events, tenancy, jobs (SRE, sync). JSON API rather than Inertia so the Hybrid Client and Web Client share the same contracts.
Web Client	Vue 3 SPA	User request; pairs with hybrid packaging.
Hybrid Client	Same Vue SPA inside Capacitor shell	User asked to <i>convert</i> the Vue app; OQ-1 closed — Hybrid in first build.
Data	PostgreSQL	Business plan §3.5; JSON/JSONB for semi-structured Evidence Record payloads where needed.
Ontology authoring	Protégé (or equivalent OWL tooling) off-platform	Business plan; runtime consumes a published, versioned export.
Queues / workers	Laravel queues for SRE re-eval and Connector sync	Keeps HTTP request path short (NFR-1, NFR-2).
Auth	Web: session; Hybrid: token (Architecture AD-18)	FR-8; SSO enablement path (FR-9).
Files	Encrypted object storage for Documentation Outputs	FR-40.

Rejected in this addendum:

- **Inertia + Blade as the only UI** — harder to wrap as hybrid without a second rendering model.
- **Separate React Native / native rewrite** — contradicts “convert the Vue app”.
- **Probabilistic AI microservice** — contradicts the SRE thesis in `prd.md`.
- **Implementing the October 2025 wireframe IA** — different product; see source analysis canvas.
- **Deferring Hybrid to post-v1** — rejected; Hybrid locked in first build.

2. Hybrid mapping

Role	Web Client	Hybrid Client
Teacher / Support Staff	Yes	Primary surface for FR-14–FR-16
SENCO	Primary (Review Cycle, outputs, Reasoning Pathway)	Yes, review + Gap list
School Leader	Primary (School Report)	Optional
Tenant Admin / Trust roles	Web only for admin density	Hybrid not required for these Roles

Offline: queue drafts on device; never imply they are on the Evidence Base until the API accepts them (prd.md FR-19). Conflict policy: server wins on Pupil identity; device drafts remain author-only until synced.

3. Permission matrix (product artefact to implement)

Enforced on the API, not only the Vue router.

Capability	Teacher	Support Staff	SENCO	School Leader	Tenant Admin	Trust SEND Lead*	Trust Executive*	Platform Operator†
Capture Observation / Intervention / Pupil Response	assigned Pupils	assigned Pupils	School	no	no	no	no	no
View Evidence Base	assigned	assigned	School	School (read)	no Pupil content	drill to School	aggregates	support read (audit)
Run/view Determinations	own captures after submit	same	School	School	no	School drill	Indicators	support
Override	no	no	yes	yes	no	no	no	no
Documentation Output	no	no	yes	view	no	view School	no	no
Import Template / Connector settings	no	no	Import	no	yes	limited	no	Pilot toolkit
User admin	no	no	no	no	yes	no	no	cross-Tenant ops
Publish Ontology / Rule versions	no	no	no	no	no	no	no	yes

* Roles exist only when Trust features are enabled.

† GuidelyEdu staff — not a Tenant Role (prd.md Glossary / FR-6).

4. SRE runtime (how, not what)

- Rules as data (tables), versioned, executed in a pure function/service so FR-29 can be tested with fixtures.
- Do not call an LLM to produce Determinations or Reasoning Pathways.
- Ontology export pipeline: Protégé → versioned artefacts → Laravel import command → publish to Tenant.

5. Connectors

Business plan cites Wonde and Groupcall as *illustrative* fabrics, plus direct MIS APIs. **OQ-4 gate:** Pilot names exactly one primary adapter before FR-48–50 implementation beyond the adapter interface. Import Template is the contractual fallback and available immediately.

6. Programme controls (not app features)

From business plan §9, required before Trust procurement: BCP/DR, encrypted backups, incident response, DPIA pack, ICO registration, contracts, Cyber Essentials roadmap. Track in operating a Trust-readiness checklist, not as Vue screens. **Pilot data gates** also require Tenant retention policy configured (no invented product default) and UK residency deployment (AD-14).

7. Options considered (product, not stack)

Option	Outcome	Why
Build the wireframe family-care product	Rejected	Paul selected business plan only.
First build = Pilot-only FRs; Phase 2–3 deferred	Rejected (2026-08-20)	Paul directed every FR (FR-1–FR-60) into the first Laravel build. Phase labels remain GTM/Tenant-flag sequencing only.
Pupils/Parents as Users in v1	Rejected	Operators in the plan are staff; adding family accounts changes GDPR, safeguarding, and GTM.
Web-only first release (no Hybrid)	Rejected (2026-08-20)	Classroom capture requires Hybrid in first build.
